

Lecture 8

Topics covered in this lecture session

1. The Binomial Theorem.
 - Pascal's Triangle and Binomial coefficients.
 - Factorial notation and formula for $\binom{n}{r}$.
2. General expansion formula $(a + b)^n$; $n \in \mathbb{R}$.
3. Applications of Binomial Theorem in approximation and error analysis.

Binomial Theorem - Introduction

Consider the expansion formulae:

$$(1 + x) = 1 + x$$

$$(1 + x)^2 = 1 + 2x + x^2$$

$$(1 + x)^3 = 1 + 3x + 3x^2 + x^3$$

$$(1 + x)^4 = 1 + 4x + 6x^2 + 4x^3 + x^4$$

Binomial coefficients

In the above expansions, the numbers

1, 1 1, 2, 1 1, 3, 3, 1 1, 4, 6, 4, 1

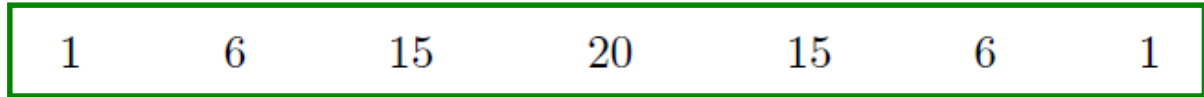

are coefficients of powers of x , are called Binomial coefficients.

These numbers are in a fixed pattern.

If we go on writing them, the pattern so formed is the Pascal's Triangle.

CELEN036 Foundation Algebra for Physical Sciences & Engineering

Binomial coefficients

What if we want to expand further? (i.e. higher order terms)

e.g. $(1 + x)^{10}$

It is definitely not meaningful to continue writing rows of the Pascal's Triangle.

In such cases, we rely on a useful formula based on factorial function/notation.

Factorial Function

By definition,

$$0! = 1,$$

and

$$\begin{aligned} n! &= n(n-1)(n-2) \dots \times 3 \times 2 \times 1 \\ &= 1 \times 2 \times 3 \times \dots (n-2)(n-1)n. \end{aligned}$$

For example, $5! = 5 \times 4 \times 3 \times 2 \times 1 = 120$.

Combinations - An important formula

$$nC_k \equiv \binom{n}{k} = \frac{n!}{k!(n-k)!}$$

For example,

$$\begin{aligned} \binom{10}{2} &= \frac{10!}{2!(10-2)!} \\ &= \frac{10 \times 9 \times 8!}{2 \times 8!} = \frac{90}{2} = 45 \end{aligned}$$

Because of their appearance as coefficients in a Binomial expansion, the numbers

$$\binom{n}{k}$$

are called Binomial coefficients.

Binomial Theorem

Using this notation, we expand $(1 + x)^n$ as:

$$(1 + x)^n = 1 + \binom{n}{1} x + \binom{n}{2} x^2 + \binom{n}{3} x^3 + \binom{n}{4} x^4 + \dots + x^n$$

By writing $x = \frac{b}{a}$ and simplifying, we get
a general formulation for Binomial Theorem as:

$$(a + b)^n = a^n + \binom{n}{1} a^{n-1} b + \binom{n}{2} a^{n-2} b^2 + \binom{n}{3} a^{n-3} b^3 + \dots + b^n$$

Binomial Theorem

Examples:

1. Expand $(x + 7)^5$ using Binomial Theorem.

Here, $a = x$, $b = 7$, and $n = 5$.

Using $(a + b)^n$

$$= a^n + \binom{n}{1} a^{n-1} b + \binom{n}{2} a^{n-2} b^2 + \binom{n}{3} a^{n-3} b^3 + \dots + b^n$$

Binomial Theorem

$$\begin{aligned}\Rightarrow (x + 7)^5 &= x^5 + \binom{5}{1} x^4 (7) + \binom{5}{2} x^3 (7)^2 + \binom{5}{3} x^2 (7)^3 \\ &\quad + \binom{5}{4} x (7)^4 + \binom{5}{5} x^0 (7)^5 \\ &= x^5 + 5 x^4 (7) + 10 x^3 (49) + 10 x^2 (343) \\ &\quad + 5 x (2401) + (1) x^0 (16807) \\ &= x^5 + 35 x^4 + 490 x^3 + 3430 x^2 + 12005 x + 16807\end{aligned}$$

Binomial Theorem

2. Expand $(1 - 3x)^4$ using Binomial Theorem.

Here, $a = 1$, $b = -3x$, and $n = 4$.

Using $(a + b)^n$

$$= a^n + \binom{n}{1} a^{n-1} b + \binom{n}{2} a^{n-2} b^2 + \binom{n}{3} a^{n-3} b^3 + \dots + b^n$$

$$\Rightarrow (1 - 3x)^4$$

$$= 1^4 + \binom{4}{1} 1^4 (-3x) + \binom{4}{2} 1^3 (-3x)^2 + \binom{4}{3} 1^2 (-3x)^3 + \binom{4}{4} (-3x)^4$$

$$= 1 + 4(-3x) + 6(9x^2) + 4(-27x^3) + (1)(81x^4)$$

$$= 1 - 12x + 54x^2 - 108x^3 + 81x^4.$$

Finding coefficient of x^n

Find the coefficient of x^3 in the expansion of $\left(3 - \frac{2x}{5}\right)^5$.

$$\left(3 - \frac{2x}{5}\right)^5 = 3^5 + \binom{5}{1} \cdot 3^4 \cdot \left(\frac{-2x}{5}\right) + \binom{5}{2} \cdot 3^3 \cdot \left(\frac{-2x}{5}\right)^2 + \boxed{\binom{5}{3} \cdot 3^2 \cdot \left(\frac{-2x}{5}\right)^3} + \binom{5}{4} \cdot 3^1 \cdot \left(\frac{-2x}{5}\right)^4 + \binom{5}{5} \cdot 3^0 \cdot \left(\frac{-2x}{5}\right)^5$$

\therefore **Term with x^3 is:** $\binom{5}{3} \cdot 3^2 \cdot \left(\frac{-2x}{5}\right)^3$

$$\begin{aligned}\therefore \text{The coefficient of } x^3 \text{ is: } & \binom{5}{3} \cdot 3^2 \cdot \left(\frac{-2}{5}\right)^3 = 10 \cdot 9 \cdot \left(\frac{-8}{125}\right) \\ & = -\frac{144}{25}\end{aligned}$$

General expansion formula

$$(1 + x)^n = 1 + nx + \frac{n(n-1)}{2!}x^2 + \frac{n(n-1)(n-2)}{3!}x^3 + \dots$$

where $n \in \mathbb{R}$ and $|x| < 1$.

Note:
$$\binom{n}{2} = \frac{n!}{2! \cdot (n-2)!}$$
$$= \frac{n \cdot (n-1) \cdot (n-2)!}{2! \cdot (n-2)!} = \frac{n \cdot (n-1)}{2!}$$

Similarly other terms can be obtained.

Generalised Binomial Theorem

$$(1+x)^n = 1 + nx + \frac{n(n-1)}{2!}x^2 + \frac{n(n-1)(n-2)}{3!}x^3 + \dots$$

where $n \in \mathbb{R}$ and $|x| < 1$.

Ex.1 Expand $(1+x)^{-3}$

$$(1+x)^{-3} = 1 + (-3)x + \frac{(-3)(-3-1)}{2!}x^2 + \frac{(-3)(-3-1)(-3-2)}{3!}x^3 + \dots$$

$$= 1 - 3x + \frac{(-3)(-4)}{2 \cdot 1}x^2 + \frac{(-3)(-4)(-5)}{3 \cdot 2}x^3 + \frac{(-3)(-4)(-5)(-6)}{4 \cdot 3 \cdot 2}x^4 + \dots$$

$$= 1 - 3x + 6x^2 - 10x^3 + 15x^4 + \dots$$

Approximation using Binomial Theorem

Approximate $(1.02)^{-1}$ using Binomial Theorem.

$$(1.02)^{-1} = (1 + 0.02)^{-1}$$

So, $a = 1$, $x = 0.02$, and $n = -1$ **NOT a positive Integer**

General expansion formula for $n \in \mathbb{R}$

$$(1 + x)^n = 1 + nx + \frac{n(n-1)}{2!}x^2 + \frac{n(n-1)(n-2)}{3!}x^3 + \dots$$

apply

where $n \in \mathbb{R}$ and $|x| < 1$.

Approximation using Binomial Theorem

As, $|x| = |0.02| < 1$.

Using $(1 + x)^n$

$$= 1 + nx + \frac{n(n-1)}{2!}x^2 + \frac{n(n-1)(n-2)}{3!}x^3 + \dots$$

$$\Rightarrow (1 + 0.02)^{-1}$$

$$= 1 + (-1)(0.02) + \frac{(-1)(-1-1)}{2!}(0.02)^2 \\ + \frac{(-1)(-1-1)(-1-2)}{3!}(0.02)^3 + \dots$$

Approximation using Binomial Theorem

$$\approx 1 - 0.02 + 0.0004 - 0.000008$$

Approximate sign is introduced because we are terminating the infinite series.

$$= 0.980392.$$

$$\text{Thus, } (1.02)^{-1} \approx 0.980392.$$

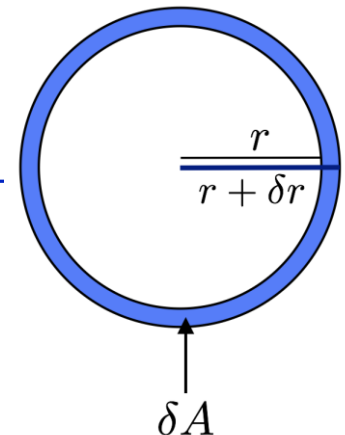

Error Analysis using Binomial approximation

Example:

The radius of a circle is measured as r , with an error of $\delta r = 1.5\%$ of r .

The area of the circle $A = \pi r^2$ is then calculated using the measured r .

Find the resulting error, δA , in the area calculated.

Note:

Using approximation, $(1 + x)^n \approx 1 + nx$.

Error Analysis using Binomial approximation

given that $\delta r = 1.5\%$ of $r \Rightarrow \delta r = 0.015r$.

Now, $A = \pi r^2$

$$\Rightarrow \cancel{A} + \delta A = \pi (r + \delta r)^2 = \pi (r + 0.015r)^2$$
$$= \pi r^2 (1 + 0.015)^2$$

$$\approx A (1 + 2 \times 0.015) \text{ using approximation } (1 + x)^n \approx 1 + nx$$

$$= A(1 + 0.03)$$

$$= \cancel{A} + 0.03 A$$

$$\therefore \delta A \approx 0.03 A$$

$$\text{i.e. } \delta A \approx 3\% \text{ of } A.$$
